

Glueball Masses from the Lattice

Biagio Lucini
Swansea University

QCD-TNT-III, Trento, September 2013

Motivations

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

- The existence of gauge-invariant bound states of gluons implied by confinement
- However, glueball states have not yet been convincingly identified in experiments
- Glueball-like states can play a key role also in strongly interacting dynamics beyond the standard model
- A calculation from first principles using lattice techniques can serve as a guidance to theoretical models and experimental searches

Configing theories

(Near-) conformal theories

Conclusions and outlook

Path integral

$$Z = \int (\mathcal{D}U_\mu(i)) (\det M(U_\mu))^{N_f} e^{-S_g(U_{\mu\nu}(i))}$$

with

$$U_\mu(i) = P \exp \left(ig \int_i^{i+a\hat{\mu}} A_\mu(x) dx \right)$$

and

$$U_{\mu\nu}(i) = U_\mu(i) U_\nu(i + \hat{\mu}) U_\mu^\dagger(i + \hat{\nu}) U_\nu^\dagger(i)$$

Gauge part

$$S_g = \beta \sum_{i,\mu} \left(1 - \frac{1}{N} \text{Re Tr}(U_{\mu\nu}(i)) \right) \quad , \quad \text{with } \beta = 2N/g_0^2$$

Masses from correlators

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

Trial operators $\Phi_1(t), \dots, \Phi_n(t)$ with the quantum numbers of the state of interest

$$\begin{aligned} C_{ij}(t) &= \langle 0 | (\Phi_i(0))^\dagger \Phi_j(t) | 0 \rangle \\ &= \langle 0 | (\Phi_i(0))^\dagger e^{-Ht} \Phi_j(0) e^{Ht} | 0 \rangle \\ &= \sum_n \langle 0 | (\Phi_i(0))^\dagger | n \rangle \langle n | e^{-Ht} \Phi_j(0) e^{Ht} | 0 \rangle \\ &= \sum_n e^{-\Delta E_n t} \langle 0 | (\Phi_i(0))^\dagger | n \rangle \langle n | \Phi_j(0) | 0 \rangle \\ &= \sum_n c_{in}^* c_{jn} e^{-\Delta E_n t} = \delta_{ij} \sum_n |c_{in}|^2 e^{-am_n t} \xrightarrow{t \rightarrow \infty} \delta_{ij} |c_{i1}|^2 e^{-am_1 t} \end{aligned}$$

Variational principle

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

- 1 Find the eigenvector v that minimises

$$am_1(t_d) = -\frac{1}{t_d} \log \frac{v_i^* C_{ij}(t_d) v_j}{v_i^* C_{ij}(0) v_j}$$

for some t_d

- 2 Fit $v(t)$ with the law $Ae^{-m_1 t}$ to extract m_1
- 3 Find the complement to the space generated by $v(t)$
- 4 Repeat 1-3 to extract m_2, \dots, m_n

Sources of systematics

- Need a good overlap of the eigenvectors with the state of interest
- Need a large variational basis including all possible states overlapping with the required one
- Need to keep under control finite size and lattice artefacts
- Care should be taken in assigning the spin

QCD at large N

Glueballs

Biagio Lucini

Lattice setup

Configuring theories

(Near-) conformal theories

Conclusions and outlook

Generalisation of QCD: $SU(N)$ gauge theory (possibly enlarged with N_f fermions in the fundamental representation)

Taking the limit $g^2 \rightarrow 0$, $N \rightarrow \infty$, $\lambda = g^2 N$ fixed simplifies the theory and one can see that:

- Quark loop effects $\propto 1/N \Rightarrow$ The $N = \infty$ limit is quenched
- Mixing glueballs-mesons $\propto 1/\sqrt{N} \Rightarrow$ No mixing between glueballs and mesons at $N = \infty$
- Meson decay widths $\propto 1/N \Rightarrow$ mesons do not decay at $N = \infty$
- OZI rule $\propto 1/N \Rightarrow$ OZI rule exact at $N = \infty$

\hookrightarrow The simpler large N phenomenology can explain features of QCD phenomenology in a *quenched* setup that removes most of the practical computational difficulties for QCD (and $SU(3)$)

Large N limit on the lattice

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

The lattice approach allows us to go beyond perturbative and diagrammatic arguments. For a given observable

1 Continuum extrapolation

- Determine its value at fixed a and N
- Extrapolate to the continuum limit
- Extrapolate to $N \rightarrow \infty$ using a power series in $1/N^2$

2 Fixed lattice spacing

- Choose a in such a way that its value in physical units is common to the various N
- Determine the value of the observable for that a at any N
- Extrapolate to $N \rightarrow \infty$ using a power series in $1/N^2$

Study performed for various observables both at zero and finite temperature for

$$2 \leq N \leq 8$$

Glueball masses at large N

- 3 Glueballs and (near-)conformal dynamics**
- 4 Conclusions and outlook

The spectrum for a QCD-like theory

Glueballs

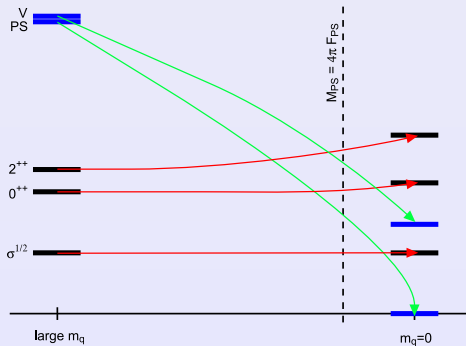

Biagio Lucini

Lattice setup

Configuring theories

(Near-) conformal theories

Conclusions and outlook

- At high fermion masses the theory is nearly-quenched
- At low fermion masses the relevant degrees of freedom are the pseudoscalar mesons

Locking

Glueballs

Biagio Lucini

Lattice setup

Configing theories

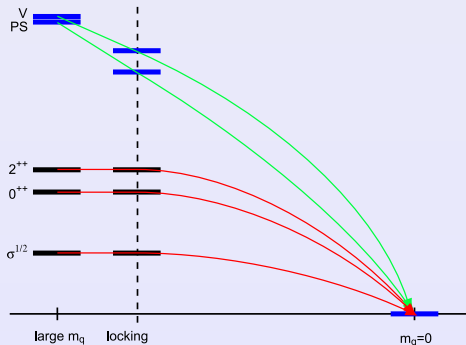

(Near-) conformal theories

Conclusions and outlook

All spectral mass ratios depend very mildly on m below the locking scale

Locking near the Banks-Zaks point

If this scenario is valid beyond BZ, at all scales $\ll \Lambda$

$$m_V/m_{PS} \simeq 1 + \epsilon$$

$$m_{PS} \gg \sigma^{1/2}$$

$$m_G/\sigma^{1/2} \simeq [m_G/\sigma^{1/2}]^{(YM)}$$

Spectrum in $SU(2)$ $N_f = 2$ Adj

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

[Del Debbio, BL, Patella, Pica and Rago, Phys. Rev. D80 (2009) 074507]

Spectrum in $SU(2) N_f = 2$ Adj

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

The pseudoscalar is always higher in mass than the 0^{++} glueball, as predicted by the locking scenario at high fermion mass

These theories naturally provide a light scalar \Rightarrow **is this a route to understanding the mechanism of electroweak symmetry breaking?**

- 4 Conclusions and outlook

Conclusions and outlook

Glueballs

Biagio Lucini

Lattice setup

Configing theories

(Near-) conformal theories

Conclusions and outlook

- Lattice calculations are an (increasingly more) useful tool to understand the fate of glueballs in QCD
 - ↪ Need to control better mixing with scattering and meson states
- Valuable information can be provided by lattice calculations in the large N limit
 - ↪ Need to take the continuum limit
- The dynamics of glueball is heavily influenced by the proximity to the conformal window
 - ↪ New classes of theories need to be explored in order to see if strongly interacting BSM dynamics is a viable mechanism of electroweak symmetry breaking
